EQUIPMENT OVERVIEW - DESIGN EDITION

Industrial system families

A starting point for discussing a custom cleaning project. These representative system families are not a confirmed product catalogue, quotation or specification.

01 Single-stage system

Discuss a stand-alone ultrasonic wash stage when the initial requirement is a defined cleaning task. Record the largest loaded workpiece, basket envelope and contamination. Confirm any separate rinse and drying requirements.

02 Multi-stage system

Consider separate washing, rinsing and drying stages when process separation matters. Define stage sequence, carry-over limits, part orientation, rinse water expectations and the method of transfer.

03 Automated line

Discuss assisted or automated transfer for recurring batches. Identify takt time, shifts, part families, upstream and downstream interfaces, footprint and space for service access.

04 What to send with your inquiry

A part drawing or photo you can share, material and coating, maximum loaded dimensions and mass, contaminant, required result, batch size, throughput and available utilities.

05 How a configuration is confirmed

Agree the cleaning objective and acceptance method first. Review a trial or a proposed sequence, then confirm equipment dimensions, options, installation requirements and commercial terms in a project-specific offer.

Planning material. Final equipment data and service terms require engineering confirmation.
