TEST PREPARATION

Sample trial checklist

Agree the trial plan with the project team before shipping parts. This checklist is for planning; it does not confirm acceptance of a shipment or a guaranteed result.

01 Define a representative sample

Record part ID, material and coating, size, mass, and the normal contamination. Photograph the same areas and mark the difficult features to inspect.

02 Agree the acceptance method

Define what counts as clean, the measurement or inspection method, comparison points, and any limits on changes to surfaces, coatings or geometry.

03 Record process restrictions

List prohibited chemicals, material compatibility concerns, temperature limits, water requirements, and handling or orientation constraints.

04 Confirm logistics first

Agree sample quantity, safe preparation, shipping instructions and disposition after the trial. Send only approved drawings or photos.

05 Compare and document

Request the agreed before-and-after observations, relevant test conditions, limitations and follow-up questions. Decide whether to revise the process or proceed to specification.

Planning material. Final equipment data and service terms require engineering confirmation.
